Teacher expectations and the belief that each student has the capacity to learn and grow is essential to supporting individual student achievement and equitable learning environments.

Researchers have shown that teacher expectations can improve or impede student outcomes. But how do students feel about the expectations and support that their schools and teachers provide? How are students’ experiences of their teachers’ expectations changing during COVID-19?

To help answer these questions, YouthTruth analyzed responses from over 120,000 secondary school students surveyed between 2016 and 2019 through YouthTruth’s anonymous student experience surveys administered in partnership with schools across 10 states. This “pre-COVID” analysis was then compared to findings from over 18,000 students surveyed in September and October 2020 across nine states.

Our analysis across both time periods investigated a subset of YouthTruth survey questions related to students’ perceptions of their teachers’ expectations and uncovered some key insights. After controlling for student- and school-level characteristics, student perceptions of teacher relationships are stronger now than before the pandemic, a testament to teachers’ support of their students during this extraordinarily challenging time.

1. Just over half of students feel that their teachers’ expectations make them want to do their best.

2. Just over half of students feel that their teachers care if they’re really learning — and this is an improvement.

3. Students are now more likely to report that their teachers don’t let them give up when the work gets hard.

4. Students are now more likely to report that teachers give them extra help when they need it.

5. Over 80 percent of students say their teachers believe they can get a good grade if they try.

As research has confirmed, teachers have the power to unleash their students’ potential when they couple innovative teaching practices with explicit and implicit messages that all students can learn.¹ When teachers model and nurture growth mindsets in the classroom and when they communicate that they believe a student has the capacity to grow, that student is more likely to believe in their own ability, take risks, and try their best.

When high school students were asked in fall 2020 if they believe that their teachers’ expectations make them want to do their best, we learn that over half – fifty-six percent – agree that their teachers’ expectations make them want to do their best. This is slightly higher than usual. Our pre-COVID-19 analysis from 2016 to 2019 reveals that prior to the COVID-19 pandemic, just fifty-one percent of students felt that their teachers’ expectations made them want to do their best.

"My teachers’ expectations make me want to do my best."

---

We also wanted to understand how students perceive their teachers’ focus on learning versus academic performance. When students perceive that a teacher’s focus is on satisfying outcomes like grades and test scores, they may experience their education as externally motivated and prioritizing the completion of tasks as opposed to “really learning.”

Across all secondary students, our analysis shows that only 55 percent of students feel that many or all of their teachers aren’t just satisfied if they pass, but care if they’re really learning. This is an improvement from our pre-COVID sample, in which 47 percent of students responded positively.

“How many of your teachers are not just satisfied if you pass, they care if you’re really learning?”

When we look at student responses disaggregated by grade level, some differences emerge. While the findings are more favorable in fall 2020 across both levels, a greater proportion of middle school students feel that their teachers care if they are really learning as compared to high school students in both time periods. The difference is particularly pronounced now, with the proportion of middle school students rating positively this fall a full 19 percentage points higher than that of high school students.
Persistence in the face of challenge (sometimes referred to as "grit") and the development of a growth mindset helps adolescents build resilience and excel academically.

“Most of my teachers don’t let people give up when the work gets hard.”

In our fall 2020 data, 65 percent of students – about three in five – agree that their teachers don’t let people give up when the work gets hard, as compared to 57 percent before the pandemic.

Differences in student perceptions by school size suggest that conditions to support persistence may be more favorable in smaller schools.* While students reported more favorable experiences in fall 2020 across both school sizes as compared to our pre-COVID sample, students at small schools had more positive experiences than their peers at large schools across both time periods.

* Large high schools are defined as having 1,200-2,500 students in enrollment; large middle schools, 800 or more students in enrollment. Small high schools are defined as having fewer than 300 students and small middle schools are defined as having fewer than 200 students.
We were also curious about how students experience extra support from their teachers when they need help. Our analysis reveals that in fall 2020, students are more likely to report that their teachers give them extra help when they need it. Prior to the pandemic, 58 percent said that many or all of their teachers would give extra help compared to 67 percent of students in fall 2020.

“How many of your teachers are willing to give you extra help on school work if you need it?”

Students are now more likely to report that teachers give them extra help when they need it.

Students are also slightly more likely in fall 2020 to report that in most of their classes, they are learning to correct their mistakes.

“In most of my classes, we learn to correct our mistakes.”
Our analysis reveals that most students — 82 percent — feel that their teachers believe they can get a good grade if they try. This is an increase of three percentage points over our pre-COVID sample. It's encouraging to see that most students feel that their teachers' expectations support growth mindsets.

“How many of your teachers believe you can get a good grade if you try.”

At first glance, this datapoint stands in tension to the grading crisis that is playing out across the country, with a greater proportion of students failing classes than ever before. What is important to note in this student perception data, however, is that students feel their teachers believe in their ability to succeed, even during this challenging context in which student performance in terms of grades is faltering.

Conclusion

These are tremendously challenging times. The COVID-19 pandemic is taxing our schools and overwhelming the already-limited resources to serve each student equitably. We know that the pandemic has led to the significant interruption of learning for millions of students and that these setbacks are especially affecting historically marginalized students.

While there are myriad challenges and alarming trends everywhere we look – from widening gaps to plummeting community college enrollment – it is also true that educators are stepping up in ways previously unimaginable. And this data affirms that students are noticing teachers' heroic efforts to challenge and support them in spite of the obstacles. While significant challenges to students' learning and well-being remain, the way students are experiencing their teachers during this time is in and of itself meaningful.

Amidst the bleak picture of traditional measures of student success, this is a time to celebrate successes where we see them and identify bright spots to inform continuous improvement. Many things are not going in the direction we'd hope right now, but students' positive message about their teachers' expectations and support is loud and clear. As we navigate the challenges of this moment, student voices must be central to the way school is reimagined.
